MGS-1818-52Q	Standalone multi-frequency GNSS smart antenna module	1.1

1 Introduction

MGS-1818-52Q is a complete standalone multi-frequency GNSS smart antenna module, including embedded patch antenna and GNSS receiver circuits which is based Airoha AG3352Q platform. The module can simultaneously acquire and track multiple satellite constellations that include GPS, GLONASS, GALILEO, BAIDOU, and QZSS simultaneously, which in combination with the support of SBAS, greatly increases the number of visible satellites and enhances positioning accuracy.

Its superior cold-start sensitivity allows it to acquire, track, and get position fix autonomously in difficult weak signal environment. Its superior tracking sensitivity allows continuous position coverage in nearly all outdoor application environments.

The module supports hybrid ephemeris prediction to achieve faster cold start. One is self-generated ephemeris prediction (called EASY) that is no need of both network assistance and host CPU's intervention. This is valid for up to 3 days and updates automatically from time to time when GNSS module is powered on and satellites are available. The other is server-generated ephemeris prediction (called EPO) that gets from an internet server. This is valid for up to 14 days. Both ephemeris predictions are stored in the on-board flash memory and perform a cold start time less than 15 seconds.

The faster GNSS fixes make it possible to use accurate positioning and navigation services anytime and anywhere with a smaller power budget than previously possible. Available in a cost-optimized version as well as a low-power version which supports for the Adaptive Low Power (ALP) feature in fitness and normal navigation modes.

9 Packing and Handling

9.1 Packing

9.2 ESD Handling

Please carefully follow the following precautions to prevent severe damage to GPS modules.

LOCOSYS GNSS smart antenna modules are sensitive to electrostatic discharges and thus are Electrostatic

Sensitive Devices (ESD). Careful handling of the GPS modules follow the standard ESD safety protections:

- Unless there is a galvanic coupling between the local (i.e. the worktable) GND and the PCB GND, then the first point of contact when handling the PCB shall always be between the local GND and PCB GND.
- Before working with the antenna feed pin, please make sure the GND is connected.
- When working with the antenna feed pin, do not contact any charges capacitors or materials that can easily develop or store charges such as patch antenna, coax cable, soldering iron.
- When soldering the antenna feed pin, please make sure to use an ESD safe soldering iron (tip).
